Model Deployment Lab

CS 203: Software Tools and Techniques for AI

Duration: 3 hours

Lab Overview

- Quantize models for efficiency

- Build FastAPI prediction service

- Dockerize the application

- Test performance and latency

- Deploy and monitor

Structure:

- Part 1: Model Optimization (45 min)

- Part 2: API Development (60 min)

- Part 3: Docker & Deployment (60 min)

- Part 4: Monitoring (15 min)

Setup

```
pip install fastapi uvicorn torch onnx onnxruntime scikit-learn joblib locust
```

Exercise 1: Model Quantization

Create and quantize a model, then compare sizes and performance.

Exercise 2: FastAPI Service

Build a complete prediction API with health checks, version management, and error handling.

Exercise 3: Docker Deployment

Containerize the service and deploy it.

Exercise 4: Load Testing

Test the API under load and optimize.

Deliverables

- Working FastAPI service

- Docker setup

- Load test results

- Monitoring dashboard
